### Small intestine

**Presented by-**  
**Dr Abhilasha**  
**Assistant Professor**  
**Department of Rachana Sharir**

| PO (Programme outcome)                                                                                                                                                                                   | CO ( Course outcome)                                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>PO 1-Demonstrate comprehensive knowledge and application of the Trisutraconcept to explore root causes, identify clinical manifestations of disease to treat ailments and maintain healthy status</p> | <p>CO6- Explain and demonstrate the gross anatomy of the organs of various systems and their applied anatomy in perspective of Ayurveda and Modern science</p> |
| <p>PO 2-Demonstrate knowledge and skills in Ayurveda, acquired through integration of multi disciplinary perspectives and keen observation of clinical and practical experiences.</p>                    |                                                                                                                                                                |

- Teaching Learnings method-Lecture with power point presentation
- Domain-Cognitive –Psychomotor
- Must to know/desirable to know/Nice to know-Must to know
- Millers pyramid-Knows and shows how
- Bloom texonomy-Remember and Understand

# Parts of the Small Intestine

- located within the GIT.
- approximately 6.5m in the average person
- assists in the digestion and absorption of ingested food.
- It extends from the pylorus of the stomach to the **ileocaecal junction**, where it meets the large intestine at the ileocaecal valve.
- Anatomically, the small bowel can be divided into three parts; the duodenum, jejunum and ileum.

# Duodenum

- The term duodenum is a Latin corruption of the Greek word, dudekadaktulos, meaning twelve fingers.
- **Definition and Location-** shortest, widest and most fixed part of the small intestine. It extends from the pylorus to the duodenojejunal flexure. It is curved around the head of the pancreas in the form of the letter 'C'. The duodenum lies above the level of the umbilicus, opposite L1,L2,L3.

# PANCRAES

**length and Parts-** 25 cm long and is divided into the following four parts-

- First or superior part- 5 cm long.
- Second or descending part- 7.5 cm long.
- Third or horizontal part- 10 cm long.
- Fourth or ascending part- 2.5 cm long.

## 1. Superior (Spinal level L1)

The first part begins at the pylorus, and passes backwards, upwards and to the right to meet the second part at the superior duodenal flexure.

Relations-

Peritoneal Relations- The proximal 2.5 cm is movable. The distal 2.5 cm is fixed. It is retroperitoneal.

## Visceral Relations-

- Anteriorly- Quadrate lobe of liver, gall bladder.
- Posteriorly- Gastroduodenal artery, bile duct and portal vein
- Superiorly - Epiploic foramen
- Inferiorly - Head and neck of the pancreas.

2. **Descending (L1-L3)** -begins at the superior duodenal flexure, passes downwards to reach the inferior duodenal flexure, to become continuous with the third part.

Relations-

Peritoneal Relations- It is retroperitoneal and fixed. Its anterior surface is covered with peritoneum, except near the middle, where it is directly related to the colon.

## Visceral Relations

Anteriorly : (a) Right lobe of the liver; (b) transverse colon, (c) root of the transverse mesocolon.

Posteriorly: (a) Anterior surface of the right kidney, (b) right renal vessels, (c) right edge of the inferior vena cava, (d) right psoas major.

Medially : (a) Head of the pancreas and (b) the bile duct

Laterally : Right colic flexure

## Internal structure of 2<sup>nd</sup> part

1. The major duodenal papilla- is an elevation present posteromedially, 8 to 10 cm distal to the pylorus. The hepatopancreatic ampulla opens at the summit of the papilla.
2. The minor duodenal papilla- is present 6 to 8 cm distal to the pylorus, and presents the opening of the accessory pancreatic duct.

### **3. horizontal part (L3)-**

It begins at the inferior duodenal flexure, on the right side of the lower border of the L3. It passes almost horizontally and slightly upwards in front of the inferior vena cava, and ends by joining the fourth part in front of the abdominal aorta.

Relations-

Peritoneal Relations- It is retroperitoneal and fixed. Its anterior surface is covered with peritoneum, except in the median plane, where it is crossed by the superior mesenteric vessels and by the root of the mesentery.

## Visceral Relations

- Anteriorly : (a) Superior mesenteric vessels and (b) root of mesentery
- Posteriorly: (a) Right ureter, (b) right psoas major, (c) right testicular or ovarian vessels, (d) inferior vena cava, and (e) abdominal aorta with origin of inferior mesenteric artery.
- Superiorly : Head of the pancreas with uncinata process
- Inferiorly : Coils of jejunum

4. **Ascending Part (L3-L2)**- It runs upwards on or immediately to the left of the aorta, up to the upper border of the L2, where it turns forwards to become continuous with the jejunum at the duodenojejunal flexure.

## Relations

Peritoneal Relations- It is mostly retroperitoneal. The terminal part is suspended by the uppermost part of the mesentery, and is mobile.

## Visceral Relations

- Anteriorly : (a) Transverse colon, (b) transverse mesocolon, (c) lesser sac, and (d) stomach.
- Posteriorly : (a) Left sympathetic chain, (b) left psoas major, (c) left renal vessels, (d) left testicular vessels, and (e) inferior mesenteric vein
- To the right: Attachment of the upper part of the root of the mesentery .
- To the left: (a) Left kidney and (b) left ureter.
- Superiorly : Body of pancreas

# Arterial Supply

- The duodenum develops partly from the foregut and partly from the midgut. The opening of the bile duct into the second part of the duodenum represents the junction of the foregut and the midgut.
- Upto the level of the opening, the duodenum is supplied by the superior pancreaticoduodenal artery, and below it by the inferior pancreaticoduodenal artery

- **Venous Drainage** - drain into the splenic, superior mesenteric and portal vein.
- **Lymphatic Drainage**- pancreaticoduodenal nodes, hepatic nodes, and through them to the coeliac nodes; and partly to the superior mesenteric nodes and ultimately via intestinal lymph trunk into the cisterna chyli.

## **Nerve Supply-**

- Sympathetic - T9-T10
- parasympathetic -vagus

# HISTOLOGY

4 layer-

1. Mucous membrane: Shows evaginations in the form of villi and invaginations to form crypts of Lieberkuhn.
2. Submucosa- is full of mucus secreting Brunner's glands.
3. The muscularis layer- comprises outer longitudinal and inner circular layer of muscle fibres.
4. Outermost layer is mostly connective tissue.

# Applied aspect

1. Duodenal ulcer/ peptic ulcer- is the erosion of the mucosa in the duodenum. Duodenal ulcers are most likely to occur in the **superior portion** of the duodenum. The most common causes of duodenal ulcers are *Helicobacter pylori* infection and chronic NSAID therapy.
- The ulcer pain located at the right half of epigastrium is relieved by meals and reappears on an empty stomach.

2. Duodenal diverticula- are fairly frequent. They are seen along its concave border, generally at points where arteries enter the duodenal wall.
3. Congenital stenosis- obstruction of the second part of the duodenum may occur at the site of the opening of the bile duct. Other causes of obstruction are (i) an annular pancreas; (ii) pressure by the superior mesenteric artery; or (iii) contraction of the suspensory muscle of the duodenum.

## True & false diverticula

True diverticulum

Examples:  
Meckel's,  
normal appendix

Pseudodiverticulum

Examples:  
Zenker's esophageal,  
common colon "ticks"

# Differences between jejunum and ileum

| Feature                   | Jejunum                                                                                                         | Ileum                                                                                                               |
|---------------------------|-----------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| 1. Location               | Occupies upper and left parts of the intestinal area                                                            | Occupies lower and right parts of of the intestinal area                                                            |
| 2. Walls                  | Thicker and more vascular                                                                                       | Thinner and less vascular                                                                                           |
| 3. Lumen                  | Wider and often empty                                                                                           | Narrower and often loaded                                                                                           |
| 4. Mesentery              | (a) Windows present<br>(b) Fat less abundant<br>(c) Arterial arcades, 1 or 2<br>(d) Vasa recta longer and fewer | (a) No windows<br>(b) Fat more abundant<br>(c) Arterial arcades, 3 or 6<br>(d) Vasa recta shorter and more numerous |
| 5. Circular mucosal folds | Larger and more closely set                                                                                     | Smaller and sparse                                                                                                  |

| Feature                         | Jejunum                                    | Ileum                                            |
|---------------------------------|--------------------------------------------|--------------------------------------------------|
| 6. Villi                        | Large, thick (leaf-like) and more abundant | Shorter, thinner (finger-like) and less abundant |
| 7. Peyer's patches              | Absent                                     | Present                                          |
| 8. Solitary lymphatic follicles | Fewer                                      | More numerous                                    |

## Parts of the Small Intestine

**Mesenteric Window**

**Peyer's Patches**

# Blood Supply

- Jejunal and ileal branches of SMA, and are drained by corresponding veins.

# Lymphatic Drainage

mesenteric nodes drain into superior mesenteric nodes.

# Nerve Supply

- Sympathetic - T9-T11
- parasympathetic -vagus

# CLINICAL ASPECT

- **Ileal Diverticulum (of Meckel)**- is the persistent proximal part of the vitellointestinal duct which is present in the embryo, and which normally disappears during the 6th week of intrauterine life.
- It occurs in 2% subjects.
- Usually it is 2 inches or 5 cm long.
- It is situated about 2 feet or 60 cm proximal to the ileocaecal valve, attached to antimesenteric border of the ileum.
- Its calibre is equal to that of the ileum.
- Its apex may be free or may be attached to the umbilicus, to the mesentery, or to any other abdominal structure by a fibrous band.

This is a 3D anatomical illustration of a segment of the small intestine. The intestine is shown as a hollow, reddish-pink tube with a visible internal fold (valve of Kerckring). A small, finger-like projection, known as Meckel's diverticulum, extends from the anterior (front) surface of the intestine. Two labels with leader lines identify the main structure and the diverticulum.

Small  
intestine

Meckel's  
diverticulum

# FORMATIVE ASSESSMENT

- **Short Answer Questions (5 Marks Each)**

1. Describe the parts of the small intestine with their extent.
2. Write the differences between jejunum and ileum.
3. Mention the blood supply and venous drainage of the small intestine.
4. Write a short note on the mesentery of the small intestine.
5. Describe the arterial arcades and vasa recta of jejunum and ileum.

thank  
you
